PROJECT DEFENSE OUTLINE — GOLDEN CRUST (STEP 22)

1. Introduction (1–2 minutes)

Present Golden Crust as a bakery management portfolio prototype with admin and customer views. Credit the group honestly.

2. Problem (2 minutes)

Explain a hypothetical small bakery's manual stock, reporting and pickup-order coordination difficulties. Do not state that real bakery interviews were conducted if they were not.

3. Objectives (1 minute)

Product management, stock auditing, customer orders, POS sales, accurate reports, validation and public demo.

4. Proposed solution (2 minutes)

An admin panel and customer storefront that use a FastAPI server and SQLite database.

5. Technologies (2 minutes)

HTML/CSS/Bootstrap and JavaScript interface; Python FastAPI server; SQLite SQL tables; GitHub source control; Render public hosting.

6. System demonstration (5–10 minutes)

- Admin signs in and views products. 2. Show quantity of a sample bread. 3. Open customer storefront, register/sign in as a fictional user and order a small number of breads. 4. Confirm stock has been reserved. 5. Return to admin orders and show Pending, Preparing, Ready, Completed as the order is processed. 6. Show completed sale on reports. 7. Show inventory activity. 8. Optionally test cancellation and stock restoration on a second sample order.

7. Database & architecture (3 minutes)

Browser → FastAPI → SQLite. Point out products, customer_orders, customer_order_items, sales and stock_movements. Explain why completing an order does not remove stock twice.

8. Problems encountered (2 minutes)

Discuss earlier FastAPI compatibility fix, cloud service start command and temporary SQLite storage. State what was actually tested.

9. Solutions (2 minutes)

Demonstrate compatibility checks, proper Uvicorn startup, GitHub deployment and maintaining a reliable local copy for defense.

10. Future improvements (1 minute)

Persistent data hosting, role permissions, notifications, payment integration, backups and better accessibility.

11. Panel Q&A

Be prepared for: Why SQLite? What is CRUD? How are customer/admin connected? What happens with insufficient stock? How are sales totals recorded? What is the main cloud limitation? What did you personally build/test?

Demo safety: Use fictional customer details, never share passwords, and avoid relying on long-lived demo transactions on Render Free.
